Tonello presents multicolour laser to color denims

Multicolor Laser is the result of an accurate investigation combining a special resin with Tonello's sustainable technologies. The study included several tests with the various parameters of Tonello Laser on different types of fabrics like cotton, leather, seamless fabric each one with different kind of finishing's and dyes. Zaitex S.p.A. and Tonello S.r.l have developed this special patent pending resin using which denim and other fabrics can be colored by laser treatment. Kit Batik treatment is used to apply this resin evenly onto the garments, which is then permanently imprinted on the fabric through a special setting of Tonello Laser. By the Batik process 96 per cent of water and 87 per cent of product are saved per process. Laser Blaze can recreate vintage effects such as localized wear, whiskers and breakages by means of the action of a laser beam. It can also create other visual effects like patterns, illusory holes, and patches.
